

Amendments to the Claims:

1. (Currently Amended) A light assembly comprising a pole having a plurality of inter-engagable sections located end-to-end to form the pole, the sections being cylindrical and each having a complementary neck and collar formation on one end and a complementary shaped first inner blind bore on an opposite end for receiving the neck of an adjacent section, and a light attached at an operatively upper end of the pole.
2. (Currently Amended) A light assembly as claimed in claim 1 in which the pole includes a light connector at an upper end thereof, the light connector comprising a housing wherein a default light is housed and wherein the pole sections are secured.
3. (Currently Amended) A light assembly as claimed in claim 1 further comprising a footpiece ~~[[is]]~~ engaged underneath an operatively lowest section of the pole.
4. (Original) A light assembly as claimed in claim 3 in which the footpiece has an operatively lower outwardly extending skirt providing a wider base section for supporting the pole.
5. (Canceled)
6. (Currently Amended) A light assembly as claimed in claim 1 wherein the interconnectable sections have a first bore in a main body of the section and a second bore[[s]] therethrough in the neck formation so that the assembled pole includes a passage therethrough.
7. (Original) A light assembly as claimed in claim 6 in which a securing line is located through the passage and secured at at least one end and to be tightened in an axial

direction at one or both ends to secure the sections of the pole together.

8. (Original) A light assembly as claimed in claim 7 in which the securing line is a rod having screw threaded ends for receiving nuts for securing the sections together.
9. (Currently Amended) A light assembly as claimed in claim [[8]] 2 wherein the light connector includes lip formations, one lip formation extending upwardly from a base thereof and the other downwardly ~~from~~ from an operatively upper end of a cylindrical section to form downwardly and upwardly facing channel sections for receiving lugs at the rear of a traffic light therein.
10. (Currently Amended) A light assembly as claimed in claim [[9]] 2, further comprising an adaptor connectable to the light connector, the adaptor having a number of sockets for receiving lights in the sockets, and wherein the adaptor in which a light is securable at any position about the cylindrical section.
11. (Currently Amended) A light assembly as claimed in claim [[10]] 9, wherein the base and cylindrical section are axially movable relative to each other to move the lip formations away from each other to facilitate insertion of lugs at the rear of a light in the opposing channels formed by the lip formations.
12. (Currently Amended) A light assembly as claimed in claim 2 further comprising an adaptor [[is]] connectable to the light connector, the adaptor having a number of sockets for receiving lights in the sockets.
13. (Previously Presented) A light assembly as claimed in claim 1 wherein the light connected to the pole includes a bank of light emitting diodes.

14. (Currently Amended) A light assembly as claimed in claim 13 in which the bank of light emitting diodes is controlled to emit one of a plurality of different colours of light at a time.
15. (Previously Presented) A light assembly as claimed in claim 13 wherein groups of light emitting diodes in the bank can be switched off while the remaining light emitting diodes are switched on to form a shape in the bank of light emitting diodes formed by the light emitting diodes remaining switched on.
16. (Previously Presented) A light assembly as claimed in claim 1 wherein the light assembly is a traffic light assembly.
